Six-Gate Optimized Hybrid Review

Scientific taste prior

- Evidence count: 3
- Optimized action: Reweight the research direction toward the most scientifically meaningful problem framing.

Evaluator stress test

- Evidence count: 1
- Optimized action: Add or repair benchmarks, baselines, metrics, and ablations before trusting a result.

Frontier steering

- Evidence count: 0
- Optimized action: Move the follow-up trajectory toward later-relevant concepts and higher-upside branches.

Verifiable micro-evolution

- Evidence count: 1
- Optimized action: Identify a machine-gradeable subproblem where OpenEvolve-style search or controlled code improvement is justified.

Structured feedback

- Evidence count: 3
- Optimized action: Transform vague feedback into concrete sections, claims, missing definitions, and reader-facing explanations.

Claim calibration

- Evidence count: 3
- Optimized action: Narrow unsupported conclusions and state exactly what the current evidence can and cannot prove.

Gate-Optimized Mini-Paper Artifact

This six-gate hybrid-review rerun revisits Rejection Improves Reliability: Training LLMs to Refuse Unknown Questions Using RL from Knowledge Feedback. The human review is not used as raw extra context; it is routed through scientific taste, evaluator stress testing, frontier steering, verifiable micro-evolution, structured feedback, and claim calibration. The resulting research plan keeps the original contribution This paper presents a new RL-based fine-tuning method that trains LLMs to recognize when they cannot provide accurate answers, thereby improving their reliability. but makes the follow-up test stricter: We will conduct experiments on various datasets, particularly focusing on arithmetic and other knowledge-intensive tasks, to measure the model's ability to reject inappropriate questions and its overall accuracy. The long-horizon branch is steered toward non-arithmetic refusal benchmarks, over-refusal and calibration metrics, user-facing safety or reliability evaluation. The claim boundary is: The findings are primarily relevant to LLMs and may not generalize to other AI models or broader contexts.

Proxy Metrics

- raw_review_guided_insight_count: 2
- six_gate_action_count: 5
- total_routed_evidence_count: 11
- short_term_gate_support_count: 7
- long_horizon_gate_support_count: 4
- frontier_target_count: 3

Case-Level Comparison

- Source case type: mixed_short_term_positive_long_term_negative
- Citation temporal pattern: short_term_positive_long_term_negative
- Semantic frontier winner: paper_context

Evidence Boundary

This artifact tests whether six-gate optimization makes review guidance more actionable. It is not yet a model-generated or benchmark-executed deep rerun.
