Six-Gate Optimized Hybrid Review

Scientific taste prior

- Evidence count: 3
- Optimized action: Reweight the research direction toward the most scientifically meaningful problem framing.

Evaluator stress test

- Evidence count: 2
- Optimized action: Add or repair benchmarks, baselines, metrics, and ablations before trusting a result.

Frontier steering

- Evidence count: 1
- Optimized action: Move the follow-up trajectory toward later-relevant concepts and higher-upside branches.

Verifiable micro-evolution

- Evidence count: 3
- Optimized action: Identify a machine-gradeable subproblem where OpenEvolve-style search or controlled code improvement is justified.

Structured feedback

- Evidence count: 3
- Optimized action: Transform vague feedback into concrete sections, claims, missing definitions, and reader-facing explanations.

Claim calibration

- Evidence count: 3
- Optimized action: Narrow unsupported conclusions and state exactly what the current evidence can and cannot prove.

Gate-Optimized Mini-Paper Artifact

This six-gate hybrid-review rerun revisits Forked Diffusion for Conditional Graph Generation. The human review is not used as raw extra context; it is routed through scientific taste, evaluator stress testing, frontier steering, verifiable micro-evolution, structured feedback, and claim calibration. The resulting research plan keeps the original contribution This work proposes a forked diffusion model that enhances conditional graph generation by introducing parent and child processes to learn and generate graphs with desired properties. but makes the follow-up test stricter: We will conduct experiments on diverse graph generation tasks, including molecular datasets, to validate the effectiveness of the forked diffusion model against existing methods. The long-horizon branch is steered toward conditional molecule generation, property satisfaction and validity metrics, baselines that test whether forking is necessary. The claim boundary is: The findings are primarily relevant to conditional graph generation and may not generalize to other types of generative models.

Proxy Metrics

- raw_review_guided_insight_count: 2
- six_gate_action_count: 6
- total_routed_evidence_count: 15
- short_term_gate_support_count: 8
- long_horizon_gate_support_count: 7
- frontier_target_count: 3

Case-Level Comparison

- Source case type: frontier_reconstruction_boundary
- Citation temporal pattern: mixed_or_tie
- Semantic frontier winner: None

Evidence Boundary

This artifact tests whether six-gate optimization makes review guidance more actionable. It is not yet a model-generated or benchmark-executed deep rerun.
